

I plan to make “The Office” TV show app for fans. The app will use list view for the navigation to each activity. I was planning on using a bottom navigation view, but I did some research and this is usually used for single view activities. It will include a character section with a spinner for each character. It will change the picture when a name is picked as well as the description for the character. There will also be a random fact view that will have a spinner with the characters names and it will give random facts about each character. There will be a voting view that will have a list view with each of the characters. You will be able to give them a rating. Then there will be a rating view that will have a list view and it will rank each of the characters based on the ratings from the voting view. I plan to use Firebase to accomplish this. My app will be used by fans of “The Office” TV show and it will give them information about the show as well as satisfy their need for “The Office” content. There are quiz apps about the office as well as quote apps, but nothing to this extent. I will only need to download images of the characters from the internet and everything else that I will need to create the app should be within Android Studio.
