

Project 1 helped get more comfortable using the things that we learned this semester. I started to really understand tableviews as well as tab controllers. I did however have some trouble with Firebase and taking the average ratings for each character as the snapshot would go through each piece of data added. I also learned how to add buttons programmatically to a tableview, which could come in handy in the future. I am thinking that Realm may have been easier to use for this situation, but that may be something that I can implement next time. From a creative side, I thought that the app layout was pretty straight forward and it worked for the information I wanted to give the user. A tableview was a good way to display each characters name and have a rating system for each character. I wanted to add stars instead of numbers for the rating, but I did not have time. Overall, I thought that the project did a good job of getting information to the fans of "The Office", but the overall ratings was the one things that didn't work so well.
